ABSTRACT

This app will help small store seller to accounting easily and make it easy for monthly periodic credit debit system. It's also help industrial buyer who pay there seller monthly or a certain time period . It's a free of cost app for android user it will also be available for ISO user .

Introduction

In this app login option is available like buyer and seller if user select buyer and login then there are option like all sellers add or remove seller . if buyer select add seller, then buyer add seller user id if buyer select remove sellers, then a list of sellers who deal previously those all will appear . Buyer had a option for create a box then after the seller entered data in it , add after certain period of time it will print all data.

Objectives

- It will help to cross check data entry of bill at the end of month .
- It's help to print all entered data in filter of data .
- This software's free of cost and all android device compatible.
- This handy software we can use anywhere, anytime.

What are the minimum hardware specifications for Android?

- The absolute minimum requirements for Android were originally a 200 MHz processor, 32 MB of RAM, and 32 MB of storage.
- Out of the box, Android is incompatible with ARMv4 or lower; ARMv5 or higher is needed to run native code without modifications.
- Android 4.4+ requires an ARMv7 processor. Custom versions have been made for ARMv6, however.

The requirements in these documents must be met for a device to be "Google Approved" and ship with the official Google apps such as the Play Store and Google Talk. However, they are not necessarily hard requirements. Since Android is open-source it can be modified to run on lesser hardware, and the opposite is possible as well — modifications necessary to run the OS on a device may make the firmware image too large to fit on it, just for example.
